

Lunar Supply

Find method for ISS docking and not get some pressure explosion. Gasket area must be made out of temp resistant material. Pressure resistant material.

Bubble design: Double zipper wetsuit design. Minimalist. Air tight zipper seal. Inflate and deflate accordingly.

Avoid having astronauts touch the surface of pod because it will be hot or cold.

Check ISS docking port. Define materials for the access hall and gasket.

Air supply pod in air sealed container?

Resin that is activated by different wave lengths?

Fans, air nozzles, and Air filter required for dust management.

Car wash systems to get dust off.

Must be able to be packaged and constructed

Cross contamination in pod.

Sucking and reusing air maybe? Pressure difference might not matter?

Supply pod orientation is a problem

Lunar pod should be protected from outside elements?

Mat restrictions

Explore pneumatic cylinder properties. Balancing cylinders and pressure in a cylindrical vacuum

General

Flow, problem, ideas, and solution. What did we exclude and include and why.
Properties of lunar surfaces: gravity, temp, and pressure.

Problem statement

Testing and simulations

See if the solution actually works.
