

Jumper

Use springs, keep camera on bottom for stabilizing center of grav and center of mass. Springs are good for absorbing impact and generating power.

Solar panels on bottom?

Phase must be designed to remove sand on landing and take off. Spring use. 3 stiff and 3 weak springs. 3 directions of motion for efficiency. Avoid having tension during impact. Have pre-impact tension established.

Find ways to reduce design brittleness.

PEBA filament- flexible/snappy.

Springs that are within other springs?

Recoiling mechanism can be self uprighting mechanism?

Must be able to be packaged and constructed

Weight concerns,

Physics should not be a problem in our designs.

Sand and rock should be kept out.
2 cameras shoot out the side?

Electromagnet system or winch method?

Battery power or solar power?

Translucent?

Gyro camera
